To determine the percentage of change from one time to another:  
divide the mostly recent monthly/annual average by the earlier monthly/annual average and subtract one.  
Most recent ÷ earlier - 1 = % of change.

Beginning in 2007, the Bureau of Labor Statistics (BLS) began to publish its consumer price indexes (CPI) rounded to three decimal places. This change made the published percent changes more precise. Historically, the CPI published index values rounded to one decimal place. The published percent changes were derived from those published index values, so that users could replicate the calculations. Because both the numerator and denominator index values were rounded to one decimal place, there was a significant probability of obtaining a different percent change using the published one-place values than with indexes with more precision. Percent changes now will be calculated using indexes rounded to three decimal places; the percent changes will continue to be published to one decimal place.
